Let's Start!

Architectures from the Viewpoint of an Enterprise

Learning Outcome:

Interpret the technical design report, to determine the work plan during the phase of building the software, based on regulation and protocols established by the company.

Design the architecture design using the appropriate tools and types according to the software requirements.

Can Do Statements:

- I can list the different types of enterprise architecture.
- I can describe four types of enterprise architecture.
- I can make comparisons between the different types of enterprise architecture.

Ask your partner:

- What type of software do companies usually use?
- What kind of technology would you like to have in your own company?

Let's Explore!

Types of Enterprise Architecture

Instructions: Read the text below.

Every time I say I'm a software architect people imagine I'm some kind of hermit that lives in a basement programming and coding applications, but they are wrong. To be a software architect, you don't really need to have the slightest clue about coding or programming. What you really need to know about is business management. To become a software architect, you will need to know how a business model is structured, understand the kind of data the company is working with, and how a company manages information.

I am going to give you a brief explanation of enterprise architecture. When we talk about enterprise architecture, we refer to distinct domains that intend to reduce the complexity of the data in a company.

Now, I'll mention the four types of enterprise architecture. First, we have business architecture, which is the most important one, as it sorts out and defines the governance and strategies of any business. Second, we have Information architecture where we find all the logical and physical data a company works with. After that, we have the application architecture, where all the individual applications to process data are developed. It serves as a blueprint for future software. Finally, the information technology architecture, which is the most dynamic of all architectures, defines all the software and hardware the company requires to build a robust information system.

If you ask me, I would say that business architecture is the most suitable of all of them to help a company meet its goals. On the other hand, application architecture is the most interactive in terms of design. Now, in terms of organization, I would say that data architecture has to be the most organized and accessed of the four categories. Finally, technical architecture is the one that requires the most support.

Let's Practice!

Characteristics of a Good Architecture

Instructions: Read the paragraph. Underline all the mistakes in the paragraph.

To become a software architect, you will needs to know how a business model is structured. If you is going to work for any company, you have to understand the kind of data the company works with. As you are go to manage important information, I are going two give you the name of the different types of enterprise architecture: business architecture, information architecture, application architecture, and technology architecture.

Let's Practice!

Some vocabulary related to enterprise architecture

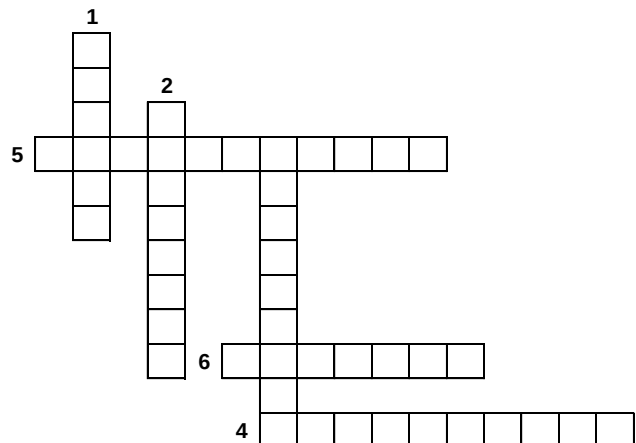

Instructions: Read the clues. Complete the crossword.

Down

1. opposite of complex
2. adaptive, malleable
3. person who designs an architecture

Across

4. the second word in the acronym IT stands for
5. piece of software, a program
6. characteristic or function

Extension Activity

Catching up with Enterprise Architecture

Instructions: Complete the following steps. Fill in the Self-Assessment.

- Research a little further about enterprise architecture.
- In your opinion, what's the best type of architecture and why?
- What's the most practical type of architecture and why?
- Create a comparative chart of the four type of enterprise architecture.
- Share your work with the class.

Self-Assessment

Yes No

- I explain the concept of enterprise architecture.
- I describe the best type of architecture.
- I classify several types of architecture.
- I compare the four types of enterprise architecture.
- I share my work with the class.

Target Words

- **hermit** (noun): a person who lives isolated from the world
e.g. Every time I say I'm a software architect people imagine I'm some kind of hermit.
- **have the slightest clue** (idiom): to know nothing about a topic
e.g. To be a software architect, you don't really need to have the slightest clue about coding or programming.
- **brief** (adjective): short
e.g. I am going to give you a brief explanation of enterprise architecture.
- **sort out** (phrasal verb): to organize something
e.g. We have business architecture, which is the most important one, as it sorts out and defines the governance and strategies of any business.
- **logical** (adjective): not physical
e.g. We have Information architecture where we find all the logical and physical data a company works with.

Learning Points

Superlatives

We use **superlatives** to compare one object with a group of objects.

You can use **superlatives** with adjectives or adverbs. In order to make a sentence using a **superlative**, you can use the following structure:

Subject + Verb + **the** + **Adjective in Superlative Form** + Complement

Example:

*She develops **the best** accounting software in the industry.*

*She is **the most talented** software coder I've ever met.*

Take a look at some rules that we need to follow in order to use adjectives in their **superlative** form:

Rule	Example
When you have 1-syllable adjectives, you add -est .	Fast = The fastest Smart = The smartest
If you have a consonant-vowel-consonant combination, you need to double the last consonant.	Big = The biggest Thin = The thinnest
If the adjective ends in a consonant + y, you eliminate the letter y and add -est .	Funny = The funniest Tiny = The tiniest
If it is a 2+ syllable adjective, you add the most before the adjective.	Expensive = The most expensive Recognized = The most recognized
Exceptions	Good = the Best Bad = The worst Far = The farthest / the furthest .

Examples

- *I would say that business architecture is the most suitable of all of them to help a company meet its goals.*
- *Application architecture is the most interactive in terms of design.*
- *Technical architecture is the one that requires the most support.*

Learning Points

Types of Enterprise Architecture

Enterprise architecture is fundamental to make a company or business work.

The types of enterprise architecture are Business Architecture, Application Architecture, Information Architecture, and Information Technology Architecture. All of them are connected and make the enterprise architecture work properly. Let's take a look at their characteristics:
