Let's Start!

What do I need to build an app?

Learning Outcome:

Interpret the technical design report, to determine the work plan during the phase of building the software, based on regulation and protocols established by the company.

Design the architecture design using the appropriate tools and types according to the software requirements.

Can Do Statements:

- I can talk about the architecture design process.
- I can describe the steps to follow in the architecture design process.

Ask your partner:

- What do you think the steps to create any software are?
- Why do you think it is important to be well documented about the company before building an app?

Let's Explore!

Jane is reading an article about app development. What is it about?

Instructions: Read the text below.

Creating an app is no child's play as many people may think. In fact, in order to create an app or any specific software, you need to follow a schema. Why? Because during the last decade, building apps and software has been a complex story as you had to take into account many different aspects. For this reason, we would rather you used the steps listed below before creating your own app.

Firstly, if I were to create an app, I would rather identify and understand the main problem the company is dealing with before starting the design. Notice that this step is the most important as it focuses on what the company has developed or offered so far to its clients. Therefore, what the app seeks is to complement or help the company. Once you identified the problematic, you have established the limits and the context of the system, which correspond to the next step, you need to identify what design elements and relationships as well as parameters the software is going to need to enclose the company's needs. This is why you can attain this step by using a design structure matrix. Thirdly, I would rather evaluate the design in order to ensure that the architectural quality of the system is as per the required standards.

Finally, if the design is suitable, you can conclude the design process. On the contrary, if something has gone wrong, simply because you have forgotten something or because the design hasn't met the standards and requirements, I'd rather transform the design or do it all over again. Either way, you can transform the architecture design by applying different styles or patterns. Once you have accomplished this step, we would rather you performed a further evaluation to guarantee a perfect design.

Let's Practice!

Building an App: Not a Child's Play

Instructions: Read the text and underline all the sentences that describe the steps to build an app. Compare and discuss your answers with your partners.

Building an app is not as easy as people may think. For that reason, it is important to identify a necessity or a problem inside the company, so that you have established in which way the app will be useful. Then, if I were you, I would rather recognize the elements that will allow the software to respond to the company's necessities. After that, it is important for you to make sure that the product you built is going to answer to the necessities you found in the first place. For that matter, I would rather ensure the architectural quality of the software by assessing the design.

Let's Practice!

Jane follows advices and steps at the moment of creating apps.

Instructions: Circle the correct option to complete each sentence. Read your answers aloud. Check your pronunciation with your instructor.

1. Jane has developed a lot of _____ for business purposes in the past years, this provided her with lots of experience
 - a. software and internet
 - b. software and apps
 - c. software and stuff
 - d. software and computers
2. She knew how important it is to follow the right steps in _____, as that is not a child's play. This is why she has developed her own designing method.
 - a. software surfing
 - b. software architecture
 - c. software and internet
 - d. software and engineers
3. Understanding the problems of the company that she has to work with has helped her to identify the _____ she needed for the correct development of the project.
 - a. elements and apps
 - b. elements and laptops
 - c. elements and feelings
 - d. elements and relationships

Let's Practice!

4. Jane has already evaluated _____ in order to make sure it attained the goals established by the company.
 - a. internet
 - b. the goals
 - c. the achievements
 - d. the design

5. If something has gone wrong, it's because you forgot something or because the design didn't meet the _____.
 - a. standards and laptops
 - b. standards and requirements
 - c. standards and devices
 - d. standards and questions

Extension Activity

Now that we know more about software architecture, it is time to think about what you can do.

Instructions: Complete the following steps. Fill in the Self-Assessment.

- a) Research about some of the apps available to the public. Remember that you should look for apps related with business and services.
- b) Write a text where you describe the steps you think were followed to create the app you found.
- c) Write a paragraph in which you describe an idea for an app. Which type of necessities does it enclose? What information do you need to start designing that app?

Self-Assessment

Yes
No

1. I search about apps and software options that solve daily problems.
2. I describe the process followed to design a software.
3. I describe and innovate with ideas related with the development of software that enclose necessities in my community.

☐ ☐
☐ ☐
☐ ☐

Target Words

- **child's play** (idiom): extremely easy; piece of cake
e.g. Creating an app is no child's play as many people may think.
- **schema** (noun): a diagram, framework or outline
e.g. In fact, in order to create an app or any specific software, you need to follow a schema.
- **enclose** (verb): to have within; encircle
e.g. Secondly, you need to identify what design elements and relationships as well as parameters the software is going to need to enclose the company's needs.
- **attain** (verb): to accomplish something
e.g. Therefore, you can attain this step by using a design structure matrix.
- **as per** (idiom): in accordance with something
e.g. Thirdly, you would rather evaluate the design in order to ensure that the architectural quality of the system is as per the required standards.
- **conclude** (verb): to finish something
e.g. Finally, if the design is suitable, you can conclude the design process.

Learning Points

Would Rather for What Is Preferable

You use **would rather** to express the preferences you have on a particular topic.

We can use **would rather** to show the preference that exists over one thing to another.

You need to take into account who the subject of the idea is. Depending on that, the construction of **would rather** changes.

If the object and the subject of the idea are the same, you use the following structure:

Subject + would rather ('d rather) + verb base form + complement

Example:

You 'd rather take a look at the manual to avoid further errors.

Learning Points

When the object of the second clause is someone different from the first subject, the structure is as follows:

subject + would rather ('d rather) + different subject + verb in past + complement

Example:

We'd rather you transformed the app design as there are some mistakes.

Notice that, even though the verb in the sentence is in past, the meaning of the sentence is in present.

Examples

- *Firstly, I would rather identify and understand the main problem the company is dealing with.*
- *For this reason, we'd rather you used the steps listed below at the moment of creating your own app.*

The Architecture Design Process

The architecture design process is important to create or design software and apps.

Before creating any app or software, it is extremely important to make a design of such software or app. To do so, you might need to follow some steps that are included in the architecture design process.

Check:

Learning Points

Architecture design process	It is the decomposition of a system into components and steps that are related to one another to meet specific functional and non-functional requirements.
1. Identify and understand the problem.	The good understanding of the problem leads to effective solutions.
2. Identify design elements.	You need to outline the boundaries of your system. Create a matrix to identify the layers of each dependency.
3. Evaluate the design.	Proper evaluation must be done to see if the attributes meet the requirements; if not, next step takes place. If so, the description is done.
4. Transform the design.	When there are changes to be done, such changes can take place as many times as necessary to ensure perfection.
