Let's Start!

That is a beautiful design!

Learning Outcome:

Interpret the technical design report, to determine the work plan during the phase of building the software, based on regulation and protocols established by the company.

Design the architecture design using the appropriate tools and types according to the software requirements.

Can Do Statements:

- I can talk about software architecture.
- I can explain what an architectural pattern or style is.
- I can tell the importance of having a good software architecture.

Ask your partner:

- What do you think is the most difficult part of a software project?
- Why is important to plan something before implementing it?

Let's Explore!

Jeremy and Janet are attending to a class. What is it about?

Instructions: Read the text below.

- Teacher:** Ok, people. Today we'll build an app from scratch to communicate with a remote server, does anyone know what the first step would be?
- Jeremy:** I think we've got to check if the server is connected to a database.
- Teacher:** Any other one, please?
- Janet:** Well, I think we have to see if the app will be an add-on or a program.
- Teacher:** Now, I want you to pay attention carefully as I'm not going to repeat twice. The first thing you have to check is what software architecture you are going to use. And, please do not tell me you don't know what I'm talking about.
- Jeremy:** Well, the thing is we thought wrong and we didn't read those copies because we pictured they were for next week.
- Teacher:** I see, you have to read better next time. Anyway, software architecture can be compared as a depiction of a system that helps to the understanding of how a program works. Let's imagine it is like the blueprint of a program.
- Janet:** Teacher, is it the same as the architectural style?
- Teacher:** Let's say that is a subset of it, in other words, an architectural pattern or style is the principles that frameworks an app, by that I mean something like the language the software is going to work with, but not the language of the interface but the one it is going to use to fully communicate within its elements. Therefore, that makes it the most important thing to bear in mind when building an app.
- Jeremy:** Why?
- Teacher:** Well, let's imagine you create an app without keeping in mind the nature of the architecture, you may create an app that doesn't communicate well with servers, databases or with its elements leaving it vulnerable to risks.

Let's Practice!

The topic of the conference is "Architectural Patterns".

Instructions: Classify the sentences by writing the number of the sentence in the correct category.

1. Architectural patterns are used to fully communicate with the elements of an app software.
2. Students will understand that an architectural pattern is the group of principles that frameworks an app.
3. Programmers must code the architectural pattern carefully.
4. The architectural pattern is the language that a software is going to work with.
5. She is talking happily about the benefits of the architectural styles.

These are future statements	These statements have adverbs of manner

Let's Practice!

They talk about the software security system.

Instructions: Match column A with Column B.

COLUMN A

1. The teacher will explain the software...
2. This system will help you to...
3. ... isn't the most appropriate to execute the project.
4. ... to be how to create an app.
5. He will check the software...
6. You have to check carefully...

COLUMN B

- a. For today, the subject of the class is going...
- b. ...the software architecture system you are going to use.
- c. He is going to edit the blueprint of this program, since it...
- d. ...security system in this company.
- e. ...architecture topic, then you have to come to class.
- f. ...understand the manner how the program works.

Extension Activity

I have creative ideas about software architecture.

Instructions: Complete the following steps. Fill in the Self-Assessment.

- Research about software architecture and architectural pattern
- Write a newspaper article about the importance of having a good software architecture.
- Read the article to your classmates and practice your pronunciation in a dynamic way with them.

Self-Assessment

Yes

No

- I read about software architecture
- I read about architectural pattern
- I write a newspaper article about the importance of having a good software architecture
- I practice my pronunciation with my classmates

☐ ☐
☐ ☐
☐ ☐
☐ ☐

Target Words

- **picture** (verb): to imagine
e.g. Well, the thing is we thought wrong and we didn't read those copies because we pictured they were for next week.
- **depiction** (noun): the way something is perceived or shown
e.g. Software architecture can be compared as a depiction of a system that helps to the understanding of how a program works.
- **framework** (verb): to outline; to give shape to something
e.g. An architectural pattern or style is the principles that frameworks an app, by that I mean something like the language the software is going to work with.
- **from scratch** (idiom): from the beginning
e.g. Today we'll build an app from scratch to communicate with a remote server.
- **subset** (adjective): to be enclosed into something bigger; to have the same properties of a bigger set but not all of them
e.g. Let's say that is a subset of it, in other words, an architectural pattern or style is the principles that frameworks an app.
- **nature** (adjective): the characteristic of something
e.g. Well, let's imagine you create an app without keeping in mind the nature of the architecture.

Learning Points

Adverbs of Manner

We use **adverbs of manner** to say how we do something.

Adverbs of manner show how things happen and answer the question (how). Adverbs of manner go in end position or after the verb if there is no object. Let's see some adverbs of manner:

Angrily, happily, fast, slowly, well, wrong, hard, carefully

If the adverb ends in **-ly**, they can go in mid position before the verb when the adverb is not the focus of the idea.

Examples:

*Children **easily** understand the app.*
*You must code it **carefully**.*

Examples

- *Now, I want you to pay attention carefully as I'm not going to repeat twice.*
- *Well, the thing is we thought wrong and we didn't read those copies because we pictured they were or next week.*
- *You may create an app that doesn't communicate well with servers, databases or with its elements leaving it vulnerable to risks.*

What is software architecture?

The **software architecture** is the blueprint of the system.

We can say the software architecture embodies all the elements that make a program work, such elements include, processes and data that are related to one another and joined inside the software architecture.

Such "blueprint" defines what designs, security, modifiability and performance a piece of software will have the engineers who design software create it foreseeing how long it will last and how it is expected to be modified.
